

IN THE CLAIMS

1. (Currently amended) Method for treating excessive blood lipid levels in humans consisting of: daily administering orally a therapeutically effective amount of fish oil concentrate, niacin, and lecithin.
2. (original) The method of claim 1 wherein lecithin is administered in two 1200mg tablets.
3. (original) The method of claim 1 wherein niacin is administered in two 500mg soft gels.
4. (original) The method of claim 3 wherein the niacin is present in the form of inositol hexanicotinate.
5. (original) The method of claim 1 wherein the fish oil concentrate is present in the form of two 1250mg soft gels.
6. (original) The method of claim 5 wherein the two soft gels contain about 450mg of eicosapentaenoic acid and about 300mg of docosahexaenoic acid.
7. (Currently amended) The method of claim 1 wherein said daily administration extends at least six weeks.
